

Release Notes

Secure Access Manager
Version 6.7.0

Exostar LLC
Final Edition
April 2026

Enhancements and Features

| Item | Description | Case ID |
|------|---|-----------|
| 1 | <p>Modernized My Account Experience</p> <p>The My Account section has been updated with a refreshed user interface for the My Profile and View Organization sub-tabs. The My Profile page now provides users with a clean, consolidated view of their account information. The View Organization page has been updated to display organization details, contacts, and administrators in a streamlined layout. While the visual design has been refreshed for these areas, the underlying workflows and functionality remain unchanged. The Credential Management sub-tab will continue to use the existing interface in this release.</p> | SAM-12402 |
| 2 | <p>SP Admin Bulk Actions</p> <p>New bulk action capabilities have been introduced for SP (Service Provider) Administrators. SP Admins can now perform bulk operations to subscribe, suspend, unsuspend, and delete application subscriptions for users within their managed applications. The tool features a robust search engine and supports CSV file upload, enabling SP Admins to efficiently manage large volumes of user subscriptions at scale. This enhancement extends the existing Bulk Action Tooling series to the SP Administrator role.</p> | SAM-11906 |
| 3 | <p>Onboarding Administrator Assistant (Beta)</p> <p>A new Onboarding Administrator Assistant has been introduced as a Beta feature to streamline the process of subscribing and unsubscribing users for adoption administrators. This tool provides administrators with a guided, file-based workflow to efficiently manage user subscriptions in bulk. Administrators can upload a file containing user information, and the assistant will process the requests, identifying existing users, new users, and any missing fields. This capability simplifies large-scale onboarding and offboarding operations. As a Beta feature, functionality may be refined based on user feedback in future releases.</p> | SAM-12959 |

Enhancements

| Item | Description | Case ID |
|------|--|-----------|
| 1 | <p>Administrators Receiving E-mails While in Suspended Status</p> <p>An enhancement has been made to prevent administrators in a suspended status from receiving administrative email notifications. Previously, suspended administrators continued to receive system-generated emails related to user actions within their organization. The system now correctly filters suspended administrators from email distribution, ensuring that only active administrators receive relevant notifications.</p> | SAM-12401 |

| | | |
|-----------------|--|-------------------------|
| <p>2</p> | <p>Rename and Expand Application Subscription Status Report to Include Total Login Count</p> <p>The Application Subscription Status Report has been renamed and expanded to include the total login count for each user. This enhancement provides administrators with more comprehensive visibility into application usage by displaying how many times each user has logged in, in addition to the existing subscription status information. The updated report enables more informed decision-making regarding application access and user activity.</p> | <p>SAM-12401</p> |
| <p>3</p> | <p>Decommission "Export Results" Functionality from Administrative Tabs</p> <p>The "Export Results" functionality has been removed from administrative tabs. This feature was previously available to administrators for exporting search results but has been decommissioned as part of ongoing platform optimization. Administrators should use the reporting tools available within the Reports tab for data export needs.</p> | <p>SAM-12401</p> |
| <p>4</p> | <p>Update Minimum Password Length to 15 Characters</p> <p>The minimum password length requirement has been updated from 8 characters to 15 characters. This change strengthens security across the platform by enforcing longer passwords for all user accounts. Existing users will be prompted to update their password to meet the new minimum length requirement upon their next password change or expiration.</p> | <p>SAM-12401</p> |
| <p>5</p> | <p>Enhance 'Enable User Access' Button to Support Shared Users and Inactive Users Suspended by Housekeeping</p> <p>The "Enable User Access" button has been enhanced to support additional user types, including shared users and inactive users who were suspended by the housekeeping process. SP Administrators can now use this button to re-enable access for shared users and users whose accounts were automatically suspended due to inactivity, streamlining the account reactivation process. Please note that if a user was explicitly suspended by another administrator, SP Admins will not be able to unsuspend those users using this functionality.</p> | <p>SAM-12401</p> |
| <p>6</p> | <p>Update Authentication Timeouts for Password Reset and Email OTP</p> <p>Timeout and validity periods have been updated for password reset links and email One-Time Passcodes (OTP) to align with updated security standards. Admin-driven password reset links will now expire 24 hours after issuance. Email OTP codes will now expire 60 minutes after issuance and will no longer be valid for authentication beyond that time. These updates strengthen authentication security while maintaining a consistent user experience across the platform.</p> | <p>SAM-13188</p> |

Defects

| Item | Description | Case ID |
|------|--|------------------|
| 1 | <p>Intermittent AUTHZ:FAILED Error When Administrators Request Application Access on Behalf of Users</p> <p>A defect has been addressed where administrators intermittently encountered an AUTHZ:FAILED error when requesting application access on behalf of users. The error occurred sporadically during the subscription process, preventing administrators from completing the request. This issue has been investigated and a fix has been implemented to ensure consistent and reliable application access requests by administrators.</p> | SAM-12894 |
